

Your
Tech,

Our
Design.

In late 2023, we were approached by Desire Energy for their new solar-based variable frequency drive.

The electronics were already in place. We were brought in to reimagine the design of the electronics' enclosure.

// *Lots of companies out there have strong ideas. Often what's missing is some help in realising those ideas as market-ready products. That's where we come in."*

User-Centric

Retrofitting technology into existing bodies leaves a cluster of human centred issues concerning usability, service and maintenance. Starting from scratch allowed the team to design specifically for context (e.g. moving the sim slot away from the heat sync) – solving both critical and mundane issues and making the product a joy to interact with on the line and in the field.

Not A Box

Curvature and Panel splits lead to a clearly defined focal point on the front of the device.

The rear casing, designed to integrate yet emphasise the heat sink, a key critical component, uses the product visual to tell a technology story.

From concept to product in 60 days

Ideation is just the first step in a product's journey. The next is bringing that design to life in the form of a fully engineered, working prototype.

With over 25 years of experience in both design and engineering, Future Factory helped take this variable frequency drive from the drawing board to real-world context in a record time of 60 days. All without any compromise on design or quality.

Manufacture Locally with Future Factory

Perceived market risk and low initial volumes make most new product development unattractive, owing to the failure of many projects. Future Factory's development and manufacturing ecosystem was meticulously developed over 20 years to address precisely these issues.

Built for high quality batch production, we ensure that our new ideas see the light of day.

energy

Future Factory is a company rooted in Innovation and Design.

We love solving problems and bettering products, be it via design ideation, user-research or enabling manufacturing.

If you have a project in mind, or an idea that you are keen on developing, we'd love to hear from you.
